

Breakthrough technology for pure and affordable water. Globally.

Two megatrends are threatening our water sources: pollution and climate change

Founded in 2016, based on breakthrough nanotechnology.

Removing micropollutants (pharmaceuticals, medicines, PFAS and insecticides), color and selective salts, but also micro- and nanoplastics, bacteria and viruses from water in one step

How it works.

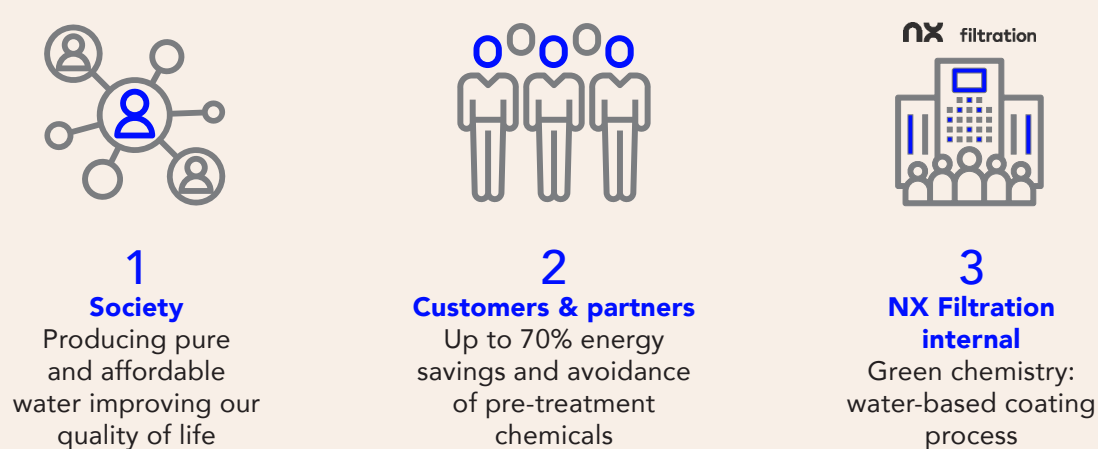

UNIVERSITY OF TWENTE.

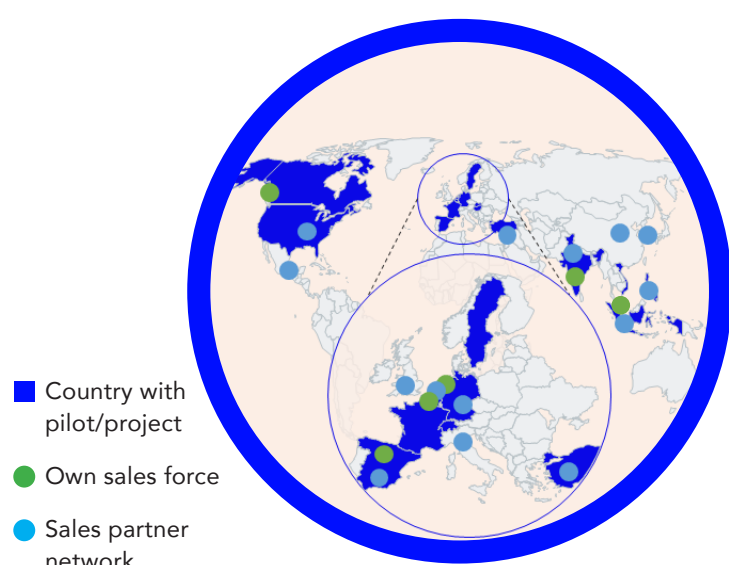

Patented products and production methods, developed over the past decade and brought to industrial scale production at NX Filtration since 2016

infestos

ESG embedded in DNA.

Proven technology around the world.

Turning an Indonesian river into a valuable source for drinking water by removing color, viruses, bacteria and micropollutants in one step

Demonstrating benefits of our nanotechnology: water quality in one single step, reduction of energy use and avoidance of pre-treatment chemicals

Cooperation program using nanofiltration for the sustainable treatment of water for retention of hardness, removal of iron and the reuse of water

IPO as accelerator for growth.

New production facility in the Netherlands

Further investments in commercial roll-out, innovation and M&A

Public profile to further boost business: stamp of professionalism, accentuating independency and attracting talent
